

ImagePress | WordPress Plugin

version 5.2

ImagePress is a multi-purpose fully-featured and WordPress-integrated image gallery plugin.

ImagePress can be installed on any WordPress site.

ImagePress is feature-packed:

- arrangement of images in unlimited levels of categories;
- image information stored in WordPress database;
- users can upload images via web interface;
- allows both registered users and non-registered users (guests);
- allows image moderation or direct publishing;
- custom sizes and unlimited styling possibilities;
- search feature;
- allows image sorting by category, date, title, ID, random, both ASC and DESC;
- random picture;
- multi-lingual;
- user comments (based on theme design and Akismet-enhanced);
- pagination options (images per page);
- easy to integrate with other WordPress plugins;
- supported formats are jpg, gif and png;
- customizable image upload size;

Help with image shortcodes

- Use the shortcode tag `[imagepress-add]` in any post or page to show the submission form.
- Use the shortcode tag `[imagepress-add category="landscapes"]` in any post or page to show the submission form with a fixed (hidden) category. Use this option for category-based contests. Use the category slug.
- Use the shortcode tag `[imagepress-add exclude="1,2,3"]` in any post or page to exclude certain categories from image submission.
- Use the shortcode tag `[imagepress-search]` in any post or page to show the search form.
- Use the shortcode tag `[imagepress-show]` in any post or page to display all images.
- Use the shortcode tag `[imagepress-show category="landscapes"]` in any post or page to display all images in a specific category. Use the category slug.
- Use the shortcode tag `[imagepress-show sort="none"]` in any post or page to hide the category sorter/selector.
- Use the shortcode tag `[imagepress-show author="yes"]` in any post or page to show the author sorter/selector.
- Use the shortcode tag `[imagepress-show count="4"]` in any post or page to display a specific number of images.
- Use the shortcode tag `[imagepress-show user="7"]` in any post or page to filter images by user ID.
- Use the shortcode tag `[imagepress type="top" mode="views" count="1"]` in any post or page to display the most viewed image.
- Use the shortcode tag `[imagepress type="top" mode="likes" count="1"]` in any post or page to display the most voted image.
- Use the shortcode tag `[imagepress mode="views"]` in a text widget to display most viewed images.
- Use the shortcode tag `[imagepress mode="likes"]` in a text widget to display most liked/voted images.

- Use the shortcode tag `[imagepress mode="likes/views" count="10"]` to adjust the number of displayed images.
- Use the shortcode tag `[imagepress-show sort="category" author="yes"]` to display category sort dropdown.
- Use the shortcode tag `[notifications]` in any post or page to display the notifications (this feature is in beta status).

Help with user shortcodes

- Use the shortcode tag `[cinnamon-profile-edit]` in any post or page to show the profile editing screen
- Use the shortcode tag `[cinnamon-profile author=17]` in any post or page to show a certain user profile, where 17 is the user ID.

Profile usage

In order to view the user profile, you need to create (or edit) the **author.php** file in your theme folder (`wp-content/themes/your-theme/author.php`) and add the following code:

```
<?php
// BEGIN AUTHOR CODE // 5.2
if(function_exists('ip_author')) {
    ip_author();
}
// END IMAGEPRESS CODE
?>
```

In order for the above to work, you need to edit your `.htaccess` file and add these lines at the end:

```
# BEGIN Cinnamon Author Rewrite
RewriteCond %{HTTP_HOST} !^www\.domain.com
RewriteCond %{HTTP_HOST} ([^\.]+\.)\.domain.com
RewriteRule ^(.*)$ ?author_name=%1
# END Cinnamon Author Rewrite
```

Requirements for portfolio subdomains (`jack.domain.com`) include active permalinks, wildcard subdomain support (contact your hosting server for more information) and FTP access to your template files.

Help with styling

Place a stylesheet file - `imagepress.css` - inside your active theme and add your own rules to override layout styling.

See `/documentation/single-image.php` for a sample single image template. Match it with your `/single.php` template structure and drop it in your active theme.

If you want to share the `single.php` template, add the following chunk of code above or below the `the_content()` function:

```
<?php
// BEGIN IMAGEPRESS CODE // 5.2
if(function_exists('ip_main')) {
    ip_main(get_the_ID());
}
```

```
        ip_related(get_the_ID()); // optional
    }
// END IMAGEPRESS CODE
?>
```

Note #1: The plugin requires WordPress 4.0 or higher in order to use all features.

Features

- HTML5 compliant
- Works with all themes
- Customizable colours and style
- Responsive

Installation

1. Upload the **imagepress** folder to your '/wp-content/plugins/' directory
2. Activate the plugin via the Plugins menu in WordPress
3. A new **ImagePress** menu will appear in WordPress containing all submitted images and existing categories (remember to visit the **ImagePress Settings** section and set up your plugin the way you want)
